

My journey into Artificial Intelligence and Machine Learning began with a curiosity about how intelligent systems can learn patterns from data and make meaningful decisions. As a Computer Science student, I have consistently explored AI/ML through academic coursework, self-learning, competitive programming, and hands-on projects.

I built my foundation by learning Python, Data Structures and Algorithms, SQL, and core machine learning concepts such as supervised learning, model evaluation, feature engineering, and data preprocessing. As I progressed, I started implementing machine learning models on real-world datasets to understand the complete development lifecycle—from data collection and cleaning to training, validation, and deployment.

One of my most significant projects involved sentiment analysis using the IMDb movie review dataset, where I worked with text preprocessing, feature extraction, and machine learning techniques to classify user sentiments. Through this project, I gained practical exposure to Natural Language Processing and learned how model performance can be improved through better data representation and parameter tuning. I have also explored recommendation systems, predictive analytics, and deep learning concepts through personal projects and online learning resources.

Beyond AI/ML, I actively strengthen my problem-solving skills through Data Structures and Algorithms. Competitive programming platforms and coding challenges have helped me develop analytical thinking, algorithmic efficiency, and the ability to approach complex problems systematically. These skills have proven valuable when implementing and optimizing machine learning solutions.

While I have gained practical experience with machine learning applications, I believe there are still important gaps in my understanding. I want to develop a deeper grasp of advanced topics such as deep neural networks, large-scale machine learning systems, representation learning, model optimization, and the mathematical foundations that drive modern AI. I am particularly interested in understanding how industry leaders design, train, and deploy machine learning models that serve millions of users reliably and efficiently.

Amazon ML Summer School 2026 presents a unique opportunity to bridge these gaps. Learning directly from researchers and engineers working on cutting-edge machine learning problems would provide insights that extend far beyond traditional classroom learning. The program's focus on both theory and real-world applications aligns perfectly with my goal of becoming an engineer capable of building scalable and impactful AI solutions.

What makes me a strong fit for this program is my combination of curiosity, technical foundation, and commitment to continuous learning. I actively seek opportunities to explore new technologies, build projects, and deepen my understanding of machine learning. I view every project as a chance to learn something new and every challenge as an opportunity to grow.

I am excited about the possibility of contributing to and learning from the MLSS community. The knowledge, mentorship, and exposure offered by the program would play a significant role in helping me advance toward my long-term goal of building intelligent systems that create meaningful impact at scale.
